

Synectics Adds Clair Ridge Project to North Sea Portfolio

Synectics has designed and delivered an end-to-end surveillance solution for Clair Ridge – the £4.5bn second phase development project taking place in the North Sea's Clair field.

Located 75km west of the UK's Shetland Islands, Clair Ridge is the most recent high profile project to feature in Synectics' North Sea portfolio, which also includes developments such as Jasmine/Judy, Golden Eagle, Shell Gannet, Shell Clipper, Erskine and Elgin.

The Clair Ridge development, due for full platform topside installation in 2015, will consist of two bridge-linked platforms – a drilling and production platform, and a second for quarters and utilities.

Production is scheduled to commence in 2015 and continue for 40 years. It is estimated that the development will produce around 120,000 barrels of oil per day and will provide a vital 'hub' for future expansion in the area. It will be the first time that BP's award-winning new LoSal® EOR extraction technique

for boosting oil yield – achieved by using desalination technology – will be used. This is expected to result in more than 40 million additional barrels being cost effectively recovered over the lifetime of the field.

Working in partnership with IT and telecommunications company Page Europa, Synectics' IP-based system – utilising Synergy™ integrated security management software – will provide complete surveillance across both platforms for safety and security processes.

(continued on other side)

Toni Partipilo, Sales Director from Page Europa, said: "As the main telecommunications and security systems integrator on this significant North Sea project, implementing a robust and intuitive end-to-end surveillance solution that would be flexible enough to provide reliable safety and security situational awareness was paramount. Synectics' solution fulfilled the brief perfectly."

COEX™ C3000 PTZ hazardous area and safe area dome camera stations will be positioned throughout the development, all of which will be centrally controllable, allowing live, colour footage to be viewed, played back and analysed without any disruption to recording. H.264 encoding technology will also enable high-quality footage to be transmitted and stored with minimal bandwidth requirements.

Amedeo Simonetto from Synectics said: "As well as providing detailed coverage for both hazardous and non-hazardous platform areas, the system we've supplied is centrally controllable and will integrate effectively with multiple third-party systems including the Driller's CCTV system.

"Additionally we factored in remote viewing capabilities, to enable head office monitoring of the platform, and also future capacity. With plans to utilise Clair Ridge as a hub for further expansion and development of the field, the system we've developed is 'future proof' as it is flexible enough to cope with additional demands."

Synectics designs integrated end-to-end surveillance control systems for the world's most demanding security environments. We excel at complex projects that require innovative, tailored solutions with high reliability and flexibility, specifically for casinos, oil and gas, marine, public space, banking, transport and critical infrastructure applications. Synectics' Systems division is part of Synectics plc, a global leader in advanced surveillance, security and integration technologies and services.
